

Stock Analyser App - Prompt Pack

This prompt pack contains ready-to-use prompts for Codex, Claude Code, Lovable, Gemini / Opal, and Perplexity Computer. All prompts use the renamed product name: Stock Analyser App.

Core product positioning

Tangible benefit: Stock Analyser App helps users find credible stock opportunities faster by combining global screening, transparent scoring, peer comparison, and source-quality checks in one place.

Shared product constraints

- Use only free/public data where feasible.
- Do not require CSV uploads.
- Do not use paid APIs in the first working version.
- Do not fabricate financial metrics.
- If a metric cannot be verified, show "Data unavailable" with source status and confidence warnings.
- Every important metric should show source, timestamp, freshness, and confidence.
- Free historical data must be labeled delayed, previous close, or historical only unless the source explicitly provides real-time data.
- The app must not present outputs as personalized financial advice.

1. Codex prompt - PRD-ready implementation task

You are working on the Stock Analyser App codebase.

Use this PRD as the source of truth for the current product state and the next implementation work.

Product: Stock Analyser App

Current app version: v1.5.0 "Console"

Current PRD version: v3.1 - Production hardening: error logging, query defaults, mobile pass

Goal:

Implement the next production-ready increment without regressing any shipped v1.0.0 to v1.5.0 behavior.

Stock Analyser App is a keyboard-driven, AI-augmented research terminal for global equities. It combines Bloomberg-style data density with an AI co-pilot layer for retail and prosumer investors who want fast research, transparent scoring, global screening, portfolio tracking, alerts, source attribution, and data-quality visibility.

Current stack:

- TanStack Start v1
- React 19
- Vite 7
- Tailwind v4
- Cloudflare Workers edge SSR
- Lovable Cloud Postgres + Auth + RLS through server functions
- shadcn/ui with Radix primitives
- sonner toaster
- Lovable AI Gateway for AI narrative and catalysts
- Perplexity news functions for News & Catalysts
- Vitest unit tests
- Playwright E2E tests

Preserve existing hardening:

- App-wide error boundary
- Router defaultErrorComponent
- Error logging pipeline
- fetchWithRetry for all outbound HTTP calls

- React Query defaults
- skip-to-main accessibility link
- focus-visible outline
- skeleton loading states
- friendly empty states
- mobile pass at 375px
- four grouped nav menus: Research, Workspace, Market, System

Immediate task:

Implement the first production-safe slice of the SourcedValue<T> roadmap.

Requirements:

1. Add canonical shared types: Freshness, Confidence, SourcedValue<T>.
2. Add helper functions for formatting sourced values, selecting badge state, stale source detection, unavailable metric detection, conflicting source detection, and summary counts.
3. Add source-quality badges: High confidence, Medium confidence, Low confidence, Verified by 2+ sources, Verified by 1 source, Stale, Conflicting, Unavailable, Mock.
4. Terminal snapshot: add compact freshness/confidence/source badges for key metrics with source and timestamp tooltip.
5. Screener rows: add source-quality badge without breaking sorting or filtering.
6. Data Quality or Sources: add metric-level audit table with Metric, Value, Source, Retrieved At, Freshness, Confidence, Warning.
7. Add summary cards for Total metrics, High confidence, Medium confidence, Low confidence, Unavailable, Conflicting, Stale.
8. Preserve skeletons, EmptyState, mobile layout, error boundaries, error logging, retry behavior, and query defaults.
9. Add tests for SourcedValue formatting, badge selection, stale detection, unavailable display, conflicting source detection, and Data Quality summary counts.
10. Run type check, lint, unit tests, and regression tests if available.
11. Update src/lib/version.ts, CHANGELOG, README, PRD, src/lib/glossary.ts, and title/aria tooltips where new UI is added.

Non-goals:

- Do not add paid APIs.
- Do not require CSV uploads.
- Do not fabricate source metadata.
- Do not replace the stack.
- Do not refactor unrelated pages.

Final response:

Summarize changes, files changed, commands run, tests passing, limitations, and follow-ups.

2. Codex prompt - Screener v2 build task

Upgrade Stock Analyser App by building the new Screener page.

This is the biggest product leap: move the app from "analyze one stock" to "discover stocks."

Use only free/public data. Do not require CSV uploads. Do not use paid APIs. Do not fabricate data. If data is unavailable, show "Data unavailable" with a warning.

Build the Screener page as the default landing page.

Core features:

1. Screener Builder

Allow users to filter stocks by region, country, exchange, sector, industry, price range, market cap range, average volume range, near 52-week low, near 52-week high, P/E range, RSI range, ROC 14D range, ROC 21D range, price above/below 20D/50D/200D MA, data confidence, verified by source count, and stale-data exclusion.

2. Saved Presets

Create presets: Value Near Lows, Momentum Leaders, Quality Large Caps, Oversold Watchlist, Breakout Candidates, Data Reliable Only.

3. Results Table

Create a sortable table with Company, Ticker, Exchange, Country, Sector, Industry, Currency, Price, Market Cap, P/E, 52W Low Distance, 5D %, RSI, ROC 14D, ROC 21D, Value Score, Momentum Score, Quality Score, Risk Score, Data Confidence.

Add sortable columns, column groups, column visibility controls, compact full-width mode, pagination or virtualization, row click to Stock Analysis, multi-select, add to watchlist, compare selected stocks, export to CSV/JSON, and source-quality badges.

4. Table / Chart View Toggle

Add Table View and Chart View. Chart View should show cards with company, ticker, price, 5D %, P/E, RSI, mini price chart, value score, momentum score, and data confidence badge.

5. Visual Scorecards

Add Value Score, Momentum Score, Quality Score, Risk Score, and Data Confidence Score. Each score must show numeric score, label, reasons, warnings, and source links where available.

6. Regional Filters

Apply default regional filters for USA, India, Europe, Japan, Hong Kong, South Korea, Taiwan, Australia, and Singapore.

7. Tests

Add unit tests for screener filter engine, presets, regional filters, value score, momentum score, quality score, risk score, and data confidence score. Add integration tests for preset results, table/chart toggle, multi-select, export, and source badges.

Final response:

Include what changed, how to run, tests added, tests passing, and known limitations.

3. Claude Code prompt

You are working on Stock Analyser App v2.

Goal:

Upgrade the app from a single-stock analyzer into a global stock discovery and analysis platform inspired by TradingView, FINVIZ, Koyfin, Simply Wall St, and StockAnalysis.com.

Core constraint:

Use only free/public data where feasible. Do not require CSV uploads. Do not use paid APIs. Do not fabricate data. If a metric cannot be verified, show "Data unavailable" with source status and confidence warnings.

Primary build priority:

Build the Screener page first.

Create or update main pages:

1. Screener
2. Stock Analysis
3. Watchlists
4. Compare
5. Data Quality
6. Sources
7. Settings

Default landing page: Screener.

Supported markets:

USA, India, Europe, Japan, Hong Kong, South Korea, Taiwan, Singapore, Australia, and China
A-shares where public data is available.

Data architecture:

Create providers for HistoricalPrice, Fundamentals, Peer, Fx, SymbolResolver, CacheStore, Screener, and Events.

Use Stooq CSV for historical OHLCV where available, official exchange pages, company investor relations pages, public financial websites, local cache, and mock demo provider only as fallback.

Build Screener features:

- Universe filters: region, country, exchange, sector, industry, listing type, currency
- Price and liquidity filters: price, market cap, average volume, 52-week distance
- Valuation filters: P/E, P/B if available, dividend yield if available
- Momentum filters: 5D performance, RSI, ROC, moving averages
- Quality filters using only verified public data
- Data-quality filters for confidence, stale data, missing metrics, and source count

Presets:

Value Near Lows, Momentum Leaders, Quality Large Caps, Oversold Watchlist, Breakout Candidates, Data Reliable Only.

Screener result table:

Company, Ticker, Exchange, Country, Sector, Industry, Currency, Price, Market Cap, P/E, 52W Low Distance, 5D %, RSI, ROC 14D, ROC 21D, Value Score, Momentum Score, Quality Score, Risk Score, Data Confidence.

Add:

- Sortable columns
- Column visibility controls
- Column groups
- Full-width compact mode
- Table/chart view toggle
- Mini price charts
- Source-quality badges
- Row click into Stock Analysis
- Multi-select
- Watchlist actions
- Compare selected stocks
- Export CSV/JSON

Add visual scorecards:

Value Score, Momentum Score, Quality Score, Risk Score, Data Confidence Score. Each must show why, warnings, and source links.

Then add or improve:

- Interactive Stock Analysis charts
- Peer comparison matrix
- Watchlists

- Compare page
- Data Quality Command Center
- Events and catalyst calendar
- Scenario-based recommendation

Testing:

Add tests for calculations, screener filters, presets, scores, data confidence, peer ranking, recommendation logic, symbol resolver edge cases, table/chart toggle, watchlist add/remove, and sources table metadata.

Run type checks, linting, and tests.

Final response:

Summarize changes, how to run, connected sources, mock fallback areas, tests, limitations, and follow-ups.

4. Lovable prompt

Build a web app called Stock Analyser App v2.

This should be a polished global stock discovery and analysis platform inspired by TradingView, FINVIZ, Koyfin, Simply Wall St, Yahoo Finance, and StockAnalysis.com.

The app should not only analyze one ticker. It should also help users discover stocks through a powerful global screener.

Use only free/public data where feasible. Do not require CSV uploads. Do not use paid APIs. Do not fabricate data. If a metric cannot be verified, show "Data unavailable" and explain what is missing.

Free or public data should always show source, URL where available, retrieved timestamp, freshness, confidence, and warning if stale, partial, conflicting, unavailable, or mock.

Main pages:

1. Screener
2. Stock Analysis
3. Watchlists
4. Compare
5. Data Quality
6. Sources
7. Settings

Default landing page: Screener.

Visual style:

Modern finance-dashboard aesthetic, dense but readable, dark terminal style, clear tables, compact badges, source-quality warnings, score bars or rings, mini price charts, responsive desktop/tablet layout.

Supported markets:

USA, India, Europe, Japan, Hong Kong, South Korea, Taiwan, Singapore, Australia, and China A-shares where public data is available.

Screener page:

Build a real screener builder with filters for region, country, exchange, sector, industry, listing type, currency, price range, market cap, average volume, near 52-week low/high, P/E, P/B if available, dividend yield if available, 5D performance, RSI, ROC, moving averages, data confidence, stale data, unavailable metrics, and verified source count.

Presets:

Value Near Lows, Momentum Leaders, Quality Large Caps, Oversold Watchlist, Breakout Candidates, Data Reliable Only.

Screener results:

Sortable table with Company, Ticker, Exchange, Country, Sector, Industry, Currency, Price, Market Cap, P/E, 52W Low Distance, 5D %, RSI, ROC 14D, ROC 21D, Value Score, Momentum Score, Quality Score, Risk Score, Data Confidence.

Add column groups, column visibility, compact mode, pagination, row click to Stock Analysis, multi-select, add to watchlist, compare selected stocks, export results, and source-quality badges.

Add Table View / Chart View toggle. Chart View should show mini chart cards with company, ticker, price, 5D %, P/E, RSI, mini price chart, value score, momentum score, and data confidence badge.

Add transparent visual scorecards:

Value, Momentum, Quality, Risk, Data Confidence. Each score should show numeric score, label, why, missing-data warnings, and source links.

Stock Analysis page:

Tabs: Snapshot, Chart, Value, Momentum, Peers, Events, Recommendation, Sources.

Charts:

Candlestick/line toggle, volume bars, 20D/50D/200D MA, RSI panel, ROC panel, 52-week high/low bands, date range selector, tooltip, data freshness badge.

Add peer matrix, watchlists, compare page, data quality command center, events calendar, and scenario-based recommendation.

Mock demo mode must be clearly labeled: "Mock demo data. Not live market data." Never silently mix mock and real data.

Always show disclaimer:

"This analysis is for informational purposes only and is not financial advice. Free-source market data may be delayed, incomplete, adjusted, stale, or unavailable. Investors should verify all data independently or consult a qualified financial advisor before making investment decisions."

5. Gemini / Opal prompt

Create a web app called Stock Analyser App.

The app should let a user enter any listed stock ticker or company name from the USA, India, Europe, or Asia-Pacific. It should automatically collect public stock data using web search and free sources. The user should not need to upload CSV files.

Do not fabricate data. If a metric cannot be verified, show "Data unavailable."

The app should include these tabs:

1. Overview
2. Value Screen
3. Momentum
4. Cross-Analysis
5. Recommendation
6. Data Quality
7. Sources

Use free no-key historical price sources such as Stooq CSV where possible. Use historical OHLCV data to calculate latest close, 52-week high, 52-week low, % from low, average daily volume, 5-day performance, 20D MA, 50D MA, 200D MA, RSI 14D, ROC 14D, and ROC 21D.

Use web search and public sources to find fundamentals: company name, exchange, country, region, currency, sector, industry, market cap, trailing P/E, average volume, peers, and earnings date if available.

Prefer sources in this order:

1. Official exchange pages
2. Company investor relations pages
3. Recognized financial data providers
4. Major finance websites
5. Public knowledge sources only for basic metadata

Show source links and retrieval timestamps for important metrics.

If a ticker is ambiguous, ask the user to select the correct listing.

Always display currency, exchange, country, region, and data freshness. Never call free historical data real-time unless the source explicitly says it is real-time.

Value Screen:

Find peer stocks within 10% of their 52-week low, with trailing P/E ≤ 10 , passing regional liquidity, price, and market cap filters. Show whether the input stock qualifies.

Momentum:

Rank top 10 peers by 5-trading-day performance. Show 5D %, ROC 14D, ROC 21D, RSI 14D, RSI label, price vs 20D/50D/200D MA, signal, 1 to 2 week outlook, and confidence.

Cross-Analysis:

Highlight stocks appearing in both value and momentum screens. If none overlap, say so.

Recommendation:

For the input stock, show bull case, bear case, base case, catalysts, fundamental risks, technical risks, final recommendation Buy/Watch/Avoid, confidence Low/Medium/High, and time horizon.

Use transparent scoring for value, momentum, and data quality. Lower confidence when sources are missing, stale, conflicting, delayed, or incomplete.

Create a Sources tab with Metric, Value, Source, URL, Retrieved At, Freshness.

Include mock demo mode only as fallback, clearly labeled "Mock demo data. Not live market data."

Always show disclaimer:

"This analysis is for informational purposes only and is not financial advice. Free-source market data may be delayed, incomplete, adjusted, stale, or unavailable. Investors should verify all data independently or consult a qualified financial advisor before making investment decisions."

6. Perplexity Computer prompt

Build a full-stack web app called Stock Analyser App.

The app should analyze listed stocks globally, including USA, India, Europe, and Asia-Pacific markets. Users should enter a ticker or company name, and the app should generate a professional investment dashboard with value screening, momentum analysis, peer comparison, and a final recommendation.

The app must not require users to upload CSV files. It should self-manage data collection using web search, free public sources, and free no-key market data sources where available.

Do not fabricate data. If a metric cannot be verified from a reliable source, show "Data unavailable" and explain what is missing.

Create a global stock research dashboard that automatically collects and analyzes historical price data, fundamentals, peer group data, technical indicators, value screening results, momentum ranking, and final recommendation.

Use free no-key historical data sources where possible, including Stooq CSV, exchange-provided historical pages, public market data pages that allow access, and other free downloadable OHLCV sources.

Use web search and public sources to retrieve company name, exchange, country, region, currency, sector, industry, market cap, trailing P/E, average daily volume, 52-week high/low, peer companies, and upcoming earnings date if available.

Implement a web search agent that can resolve the correct listing, identify peers, retrieve fundamentals, cross-check important metrics across at least two sources where possible, store source URLs and retrieval timestamps, and show citations or source links in the UI.

Use this source priority:

1. Official exchange data
2. Company investor relations
3. Recognized financial data providers
4. Major finance websites
5. Public knowledge sources for basic metadata only

Do not use random blogs, forums, social media posts, or unverified pages for financial metrics.

Cache company metadata, fundamentals, peer lists, historical price data, source URLs, retrieval timestamps, and freshness labels.

Ticker resolution should support company-name search, ambiguous ticker warnings, ADR/local share warnings, and multiple-listing detection.

Dashboard sections:

Overview, Value Screen, Momentum, Cross-Analysis, Recommendation, Data Quality, Sources.

Value Screen:

Find peer companies that trade within 10% of the 52-week low, have trailing P/E ≤ 10 , pass regional liquidity, price, and market cap filters, and have sufficient data quality.

Momentum:

Rank top 10 peer stocks by 5-trading-day performance. Show ROC 14D, ROC 21D, RSI 14D, RSI label, price vs 20D/50D/200D MA, signal classification, outlook, and confidence.

Recommendation:

Provide bull case, bear case, base case, catalysts, risks, final Buy/Watch/Avoid rating, confidence, and time horizon.

Sources tab:

List Metric, Value, Source, URL, Retrieved At, Freshness.

Mock demo mode should be available only as fallback and clearly labeled.

Always show disclaimer:

"This analysis is for informational purposes only and is not financial advice. Free-source market data may be delayed, incomplete, adjusted, stale, or unavailable. Investors should verify all data independently or consult a qualified financial advisor before making investment decisions."
